## Amendments to the Specification:

Please replace the paragraph beginning at page 19, line 12, with the following rewritten paragraph:

At step 35, it is determined if the mobile terminal want wants to permanently end its wireless IP network connection. If the mobile terminal does not want to permanently end its wireless IP network connection, then the process proceeds to step 27. If the mobile terminal does want to permanently end its wireless IP network connection, then the process proceeds to step 36. At step 36, the mobile terminal drops all remaining multicast network connections by broadcasting "leave" messages to the remaining multicast participants in order to terminate all remaining multicast network connections, after which the residual IP network interfaces that result from the drop are terminated. The mobile terminal then terminates any remaining non-multicasting IP network connections to end its wireless IP network connection (step 38).
